

**Title:** Personal Appraisal of Support for Stuttering

**Aim and Rationale:** This study's purpose is to document the supportiveness of common public reactions, behaviors, or interventions to stuttering. More specifically, it will compare the opinions of stuttering adults who have and have not been involved in speech therapy, self-help support, or both. Results of this study hope to increase our awareness of what types of responses, supports and services those who stutter find helpful, so that resources and programs can be planned accordingly. This study requires completion of an online survey, the Personal Appraisal of Support for Stuttering (PASS), developed through Qualtrics, an online survey software. The survey will take about 10 minutes to complete. If you are 18 years of age or older and a person who stutters or who as stuttered in the past, we would appreciate your consideration in helping us with this project.

**You can access the survey by clicking on the following link:**
